Manufacturing: Availability of using/applying overhead and additional costs to a Manufacturing Process Confirmation

Summary

Let's help you understand the availability of, and using/applying overhead and additional costs to a Manufacturing Process in Sage 200 Evolution.

Description

This article discusses/confirms the availability of using/applying overhead costs and additional transactional costs to a Manufacturing Process Confirmation.

Resolution

Please note that it's not possible to add additional costs to a Manufacturing Process within the Manufacturing or BOM module.

However, the Manufacturing module can be used in conjunction with the Job Costing module in which any number of overhead and additional costs can be added to your manufacturing activities.

That is because the Job Costing module has a feature called Make Inventory Item.

Therefore, consider the following procedure:

1. The manufactured master item as produced in the Manufacturing module is selected as a transaction line within a new Job Costing job card.

2. In addition, the relevant overhead and additional costs are also captured on separate transaction lines.

3. After all transaction lines have been added only (not invoiced and only added to Work in Progress), click the Save, Process & Close button on the top of the opened Job Card screen.

4. You can now click the Make Inventory Item button on the top of the Job Card grid screen. This initiates the Job Costing's own manufacturing procedure.

5. Finally, select the Inventory Item to be manufactured and complete the rest of the relevant fields. When done, click the OK button below. Doing this removes the Job Card's transaction lines out of WIP and archives the job card as a whole.

Keywords overhead additional costs
