Optimising the network speed on Evolution server and all workstations

On the Evolution server and workstation PC, do the following:

- 1. Close all applications and connection on the local PC.
- 2. Right click on the network icon below on the PC's System Tray (bottom right of monitor).

3. Click the option marked below.

4. Click the **Ethernet** button below.

Settings	
Home	Ethernet
Find a setting	
Network & Internet	root.adinternal.com Connected
🔛 Ethernet	
% VPN	
🕒 Data usage	
Proxy	

5. On the right side of the screen, click the link marked below

6. Right click on the Ethernet network card and select Properties.

7. Click the **Configure** button below.

Ethernet Properties	s	×
Networking		
Connect using:		
Intel(R) Etheme	t Connection I217-LM	
This connection uses	the following items:	Configure
Client for Mc File and Print File and Print Gos Packet Gos Packet File Anternet Proto Anternet	rosoft Networks er Sharing for Microsoft DIS6 Bridged Networkin Scheduler bool Version 4 (TCP/IPv twork Adapter Multiplexo DP Protocol Driver	Networks g Driver 4) or Protocol
Install	Uninstall	Properties
Description Allows your comput network.	er to access resources o	on a Microsoft K Cancel

8. On the Advanced tab click on the Speed and Duplex property below. On the right side, select the specific speed option as relevant to you own local network.

- 9. Click the Ok button above to save the change. Notice how the network connection may be rapidly temporarily dropped and then re-initialised.
- 10. The Evolution and general network speed should now be significantly increased as well as promoting a higher level of network stability.
